

# M<sup>2</sup> = Math Mediator Lesson 36: Polynomial Functions

<p>Total Recall (Warm-up) (5 minutes approx.)</p>	<p>Total Recall: Exercises based on the definition of <i>polynomial</i>: <b>A polynomial is a monomial or any sum of monomials.</b></p> <p>1. Which of the following are monomials, which are polynomials?</p> <p>a. 7 (Answer: 7 is both a monomial and polynomial, it is also a constant).</p> <p>b. <math>3x^2 + 2x + 3</math> (Answer: it is a polynomial, sum of monomials)</p> <p>c. <math>2xy</math> (Answer: Both monomial and polynomial. There are three terms in this polynomial, 2 is constant, x and y are variable terms.).</p> <p>d. <math>3t^2v</math> (Answer: Both monomial and polynomial.)</p>														
<p>Direct Instruction and Activity: (20 minutes approx.)</p> <p><b>CA Std 3.0, 4.0 and 10.0</b></p>	<p>Previous lessons involved quadratics: <math>y = ax^2 + bx + c</math> (Quadratic means that there is a term taken to the 2<sup>nd</sup> degree, here is shown in standard form). We presented a use of quadratics was for projectiles or dropped objects, how gravity effected those objects. Quadratics produce parabolas when graphed. Parabolas are used in graphic design (logos) and lampshade design.</p> <p>A quadratic function is expressed as <math>f(x) = ax^2 + bx + c</math>. The area of a rectangle can produce a quadratic, given the length and width of the sides as '2x' and 'x', and knowing the area of a rectangle is length times width or <math>A = lw = 2x(x) = 2x^2</math>.</p> <p>Adding another dimension to the area of a rectangle gives us volume. Volume of a rectangle is length times width times height or <math>V = l \times w \times h</math>. Today, we will construct several 'pans' from 8" x 10" construction paper. We will use different heights to see how the volume changes and then plot the solutions. Start by handing out at least 6 pieces of construction paper. Have students use the template below to construct the pan from the paper, and then record the data in a table, shown:</p> <div style="display: flex; align-items: center;">  <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>x</th> <th>volume</th> </tr> </thead> <tbody> <tr> <td>1"</td> <td></td> </tr> <tr> <td>1.5"</td> <td></td> </tr> <tr> <td>2"</td> <td></td> </tr> <tr> <td>2.5"</td> <td></td> </tr> <tr> <td>3"</td> <td></td> </tr> <tr> <td>3.5"</td> <td></td> </tr> </tbody> </table> </div> <p>1. Make several 'pans' from construction paper:</p> <ol style="list-style-type: none"> <li>Cut squares of 'x' dimension from corners.</li> <li>Fold sides up and tape corners.</li> <li>Measure length, width and height, calculate volume.</li> <li>Enter volume into the table.</li> </ol> <p>2. Write a function that describes the volume of the 'pans', in terms of 'x'.</p> <ol style="list-style-type: none"> <li>Answer: <math>f(x) = (10 - 2x)(8 - x)x</math></li> </ol> <p>3. Graph the function on your calculator. What are the <math>y = 0</math> points (hint:</p>	x	volume	1"		1.5"		2"		2.5"		3"		3.5"	
x	volume														
1"															
1.5"															
2"															
2.5"															
3"															
3.5"															

# M<sup>2</sup> = Math Mediator Lesson 36: Polynomial Functions

	<p>use <math>x = 0, 4</math> and <math>5</math>)? What is the maximum value of <math>y</math>? What is the maximum volume?</p> <p>4. Use the standard form for polynomials: <math>f(x) = (x - r_1)(x - r_2)(x - r_3)</math> with <math>r_1 = 0</math>; <math>r_2 = 4</math>; and <math>r_3 = 5</math> (zeros or roots from #3). Plot this equation on your calculator: <math>f(x) = (x - 0)(x - 4)(x - 5)</math>. Does it look the same as the previous plot from #3? No, because we forgot to multiply by the 'a' value of 4, which we factored out of the original function. <math>f(x) = a(x - 0)(x - 4)(x - 5) = f(x) = 4(x - 0)(x - 4)(x - 5)</math>.</p>																		
Terms: (10 minutes approx.)	<p>POLYNOMIAL TERMS:</p> <table border="1"> <thead> <tr> <th>Degree</th> <th>Type</th> <th>Example</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>Constant</td> <td><math>f(x) = 3</math></td> </tr> <tr> <td>1</td> <td>Linear</td> <td><math>f(x) = 2x + 3</math></td> </tr> <tr> <td>2</td> <td>Quadratic</td> <td><math>f(x) = 2x^2 - 12x + 72</math></td> </tr> <tr> <td>3</td> <td>Cubic</td> <td><math>f(x) = 4x^3 - 36x^2 + 80x + 0</math></td> </tr> <tr> <td>4</td> <td>Quartic</td> <td><math>f(x) = x^4 + 2x^3 + 3x^2 - 2x - 6</math></td> </tr> </tbody> </table> <p>**Polynomials are NOT expressions with variables as exponents: <math>2^x</math> or expressions with the variable raised to a non-whole number, such as <math>1.5</math> or <math>-1</math>, where the variable is in the denominator: <math>1/(2x)</math>.</p> <p>U-DO: Which of the following are polynomials?</p> <ol style="list-style-type: none"> <li><math>16x^2 - 36x - 2^x</math> Answer: Not a polynomial, variable is exponent.</li> <li><math>8x^3 + 24x^2 - 36x^{1.5} + 36x - 72</math> Answer: Not a polynomial, exponent is not whole number.</li> <li><math>8x^2 - 36x - 72</math> Answer: Yes, it is a polynomial. Degree 2, quadratic.</li> <li><math>4x^2 + 16x - \frac{4}{x} + 2</math> Answer: No, variable is in denominator.</li> </ol>	Degree	Type	Example	0	Constant	$f(x) = 3$	1	Linear	$f(x) = 2x + 3$	2	Quadratic	$f(x) = 2x^2 - 12x + 72$	3	Cubic	$f(x) = 4x^3 - 36x^2 + 80x + 0$	4	Quartic	$f(x) = x^4 + 2x^3 + 3x^2 - 2x - 6$
Degree	Type	Example																	
0	Constant	$f(x) = 3$																	
1	Linear	$f(x) = 2x + 3$																	
2	Quadratic	$f(x) = 2x^2 - 12x + 72$																	
3	Cubic	$f(x) = 4x^3 - 36x^2 + 80x + 0$																	
4	Quartic	$f(x) = x^4 + 2x^3 + 3x^2 - 2x - 6$																	
Practice: (5 minutes)	<p>U-DO: Find <math>f(x)</math> for <math>x = 2</math>; where <math>f(x) = x^4 + 2x^3 + 3x^2 - 2x - 6</math></p> <p>Answer: <math>2^4 + 2(2^3) + 3(2^2) - 2(2) - 6 = 16 + 16 + 12 - 4 - 6 = 34</math></p>																		
Practice (10 minutes approx.)	<p>U-DO: Plot the following equations on your graphing calculator. Using the zeros from the plot, re-write the equations in root form: <math>f(x) = (x - r_1)(x - r_2)(x - r_3)</math></p> <ol style="list-style-type: none"> <li><math>f(x) = 4x^3 + 8x^2 - 36x - 72</math> Answer: <math>f(x) = 4(x - 3)(x + 2)(x + 3)</math></li> <li><math>f(x) = 0.5(x^4 + x^3 - 42x^2 - 36x + 216)</math> Answer: <math>0.5(x + 6)(x + 3)(x - 2)(x - 6)</math></li> <li><math>f(x) = 3x^3 + 15x^2 - 12x - 60</math> Answer: <math>3(x + 5)(x + 2)(x - 2)</math></li> </ol>																		
Wrap-up (5 minutes approx.)	<p>Wrap up closing comments and housekeeping.</p>
